🎨 What is Rendering in React?

Rendering means telling React **what to show** on the screen.

elements are **plain objects** that describe what you want to appear in the UI. React uses these elements to update the **DOM** efficiently using its **Virtual DOM** system.

◆ Basic Rendering Example

jsx   ⧉ Copy   ✎ Edit

```jsx
const element = <h1>Hello, React!</h1>; ReactDOM.render(element,
document.getElementById('root'));
```

- `element` : JSX that represents what you want to render.
